

ABSTRACT

The invention relates to a folding top for a cabriolet vehicle, comprising a first roof part (1) which rests on a rear element (10) of the vehicle, which can be opened, in the closed covering position, a second roof part (2) which is pivotably mounted on the vehicle and is disposed in front of the first roof part (1) in the direction of traffic when said second roof part (2) is in a closed covering position, a third roof part (3) which is disposed in front of the second roof part (2) in the direction of traffic when said third roof part (3) is in a closed covered position. The first roof part (1) can be lifted from the rear element (10). The aim of the invention is to create a folding top with a particularly simple kinematic configuration. Said aim is achieved by allowing the third roof part to be moved over the second roof part.
